

# The Star Formation of NGC 2024

Nagoya University Affiliated Upper Secondary School  
55013

# 0. Introduction

## Star Formation

The processes of star forming and progress

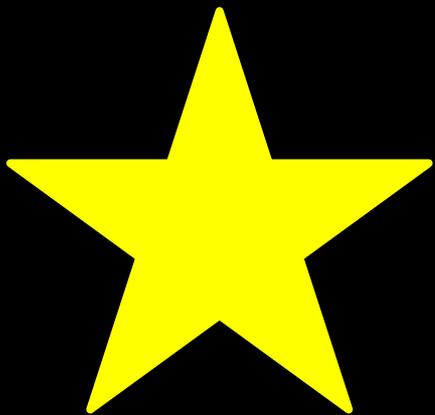

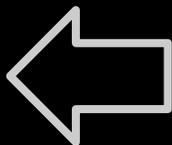

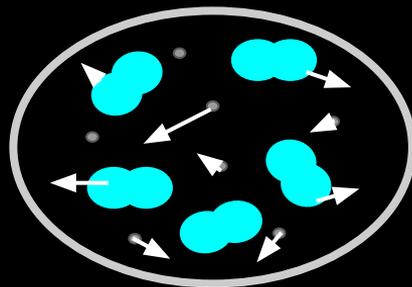

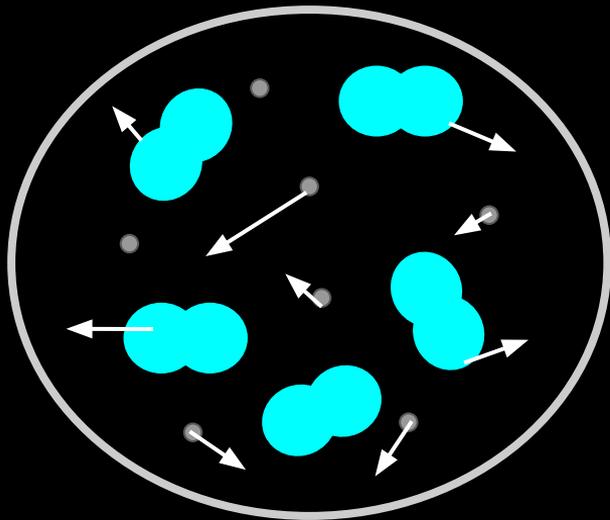

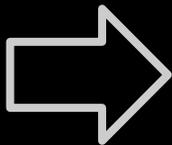

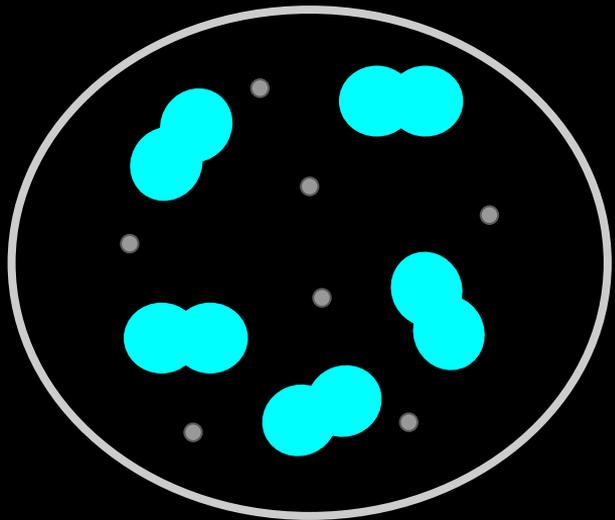

Unknown

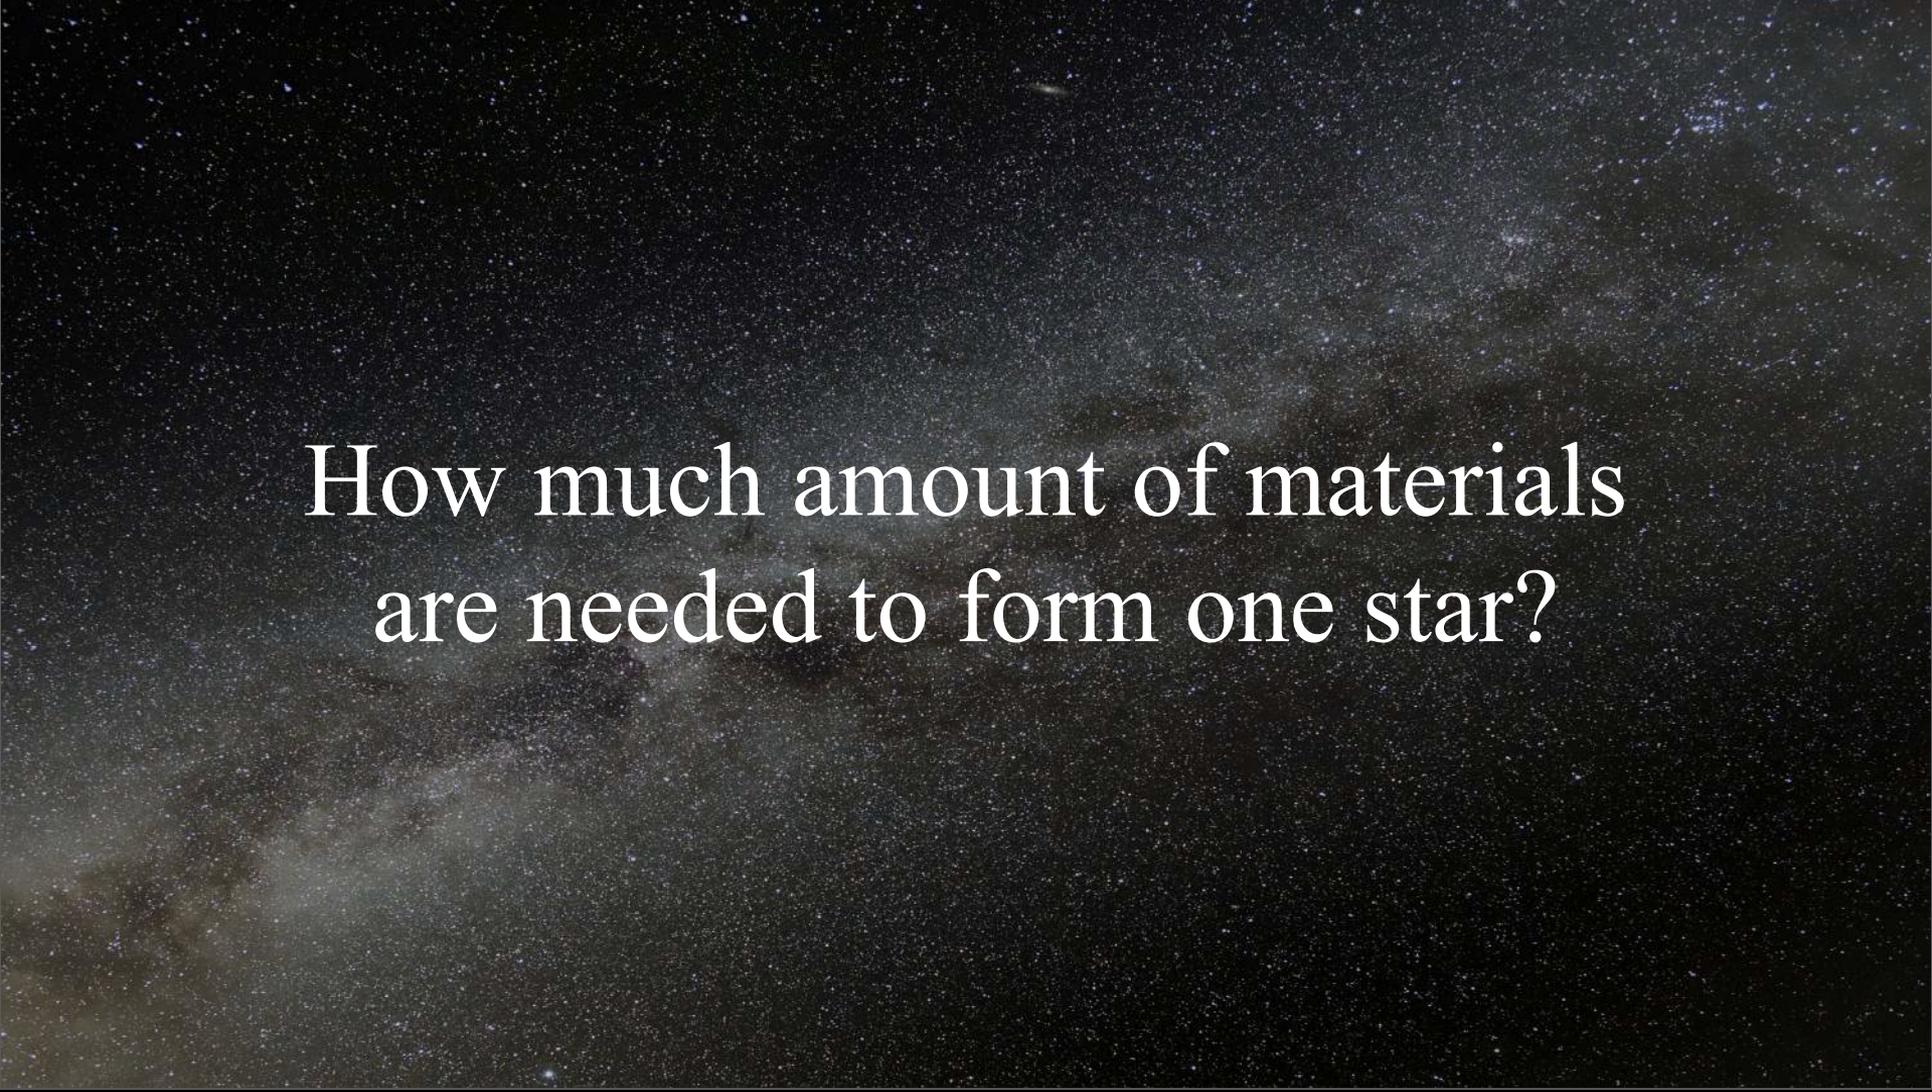

- Process of star formation

Generate energy

→ High efficiency, No emission of GHG

The background is a dark, deep space scene filled with numerous small, distant stars. A prominent feature is a diffuse, glowing nebula or galaxy structure that stretches across the lower-left and central portions of the frame, showing various shades of blue, purple, and white. The overall texture is grainy and speckled, characteristic of a high-resolution astronomical image.

How much amount of materials  
are needed to form one star?

# 1. Method

**NGC 2024** - Molecular cloud  
- H<sub>2</sub>, CO, dust

## Data

- Nobeyama 45m radio telescope

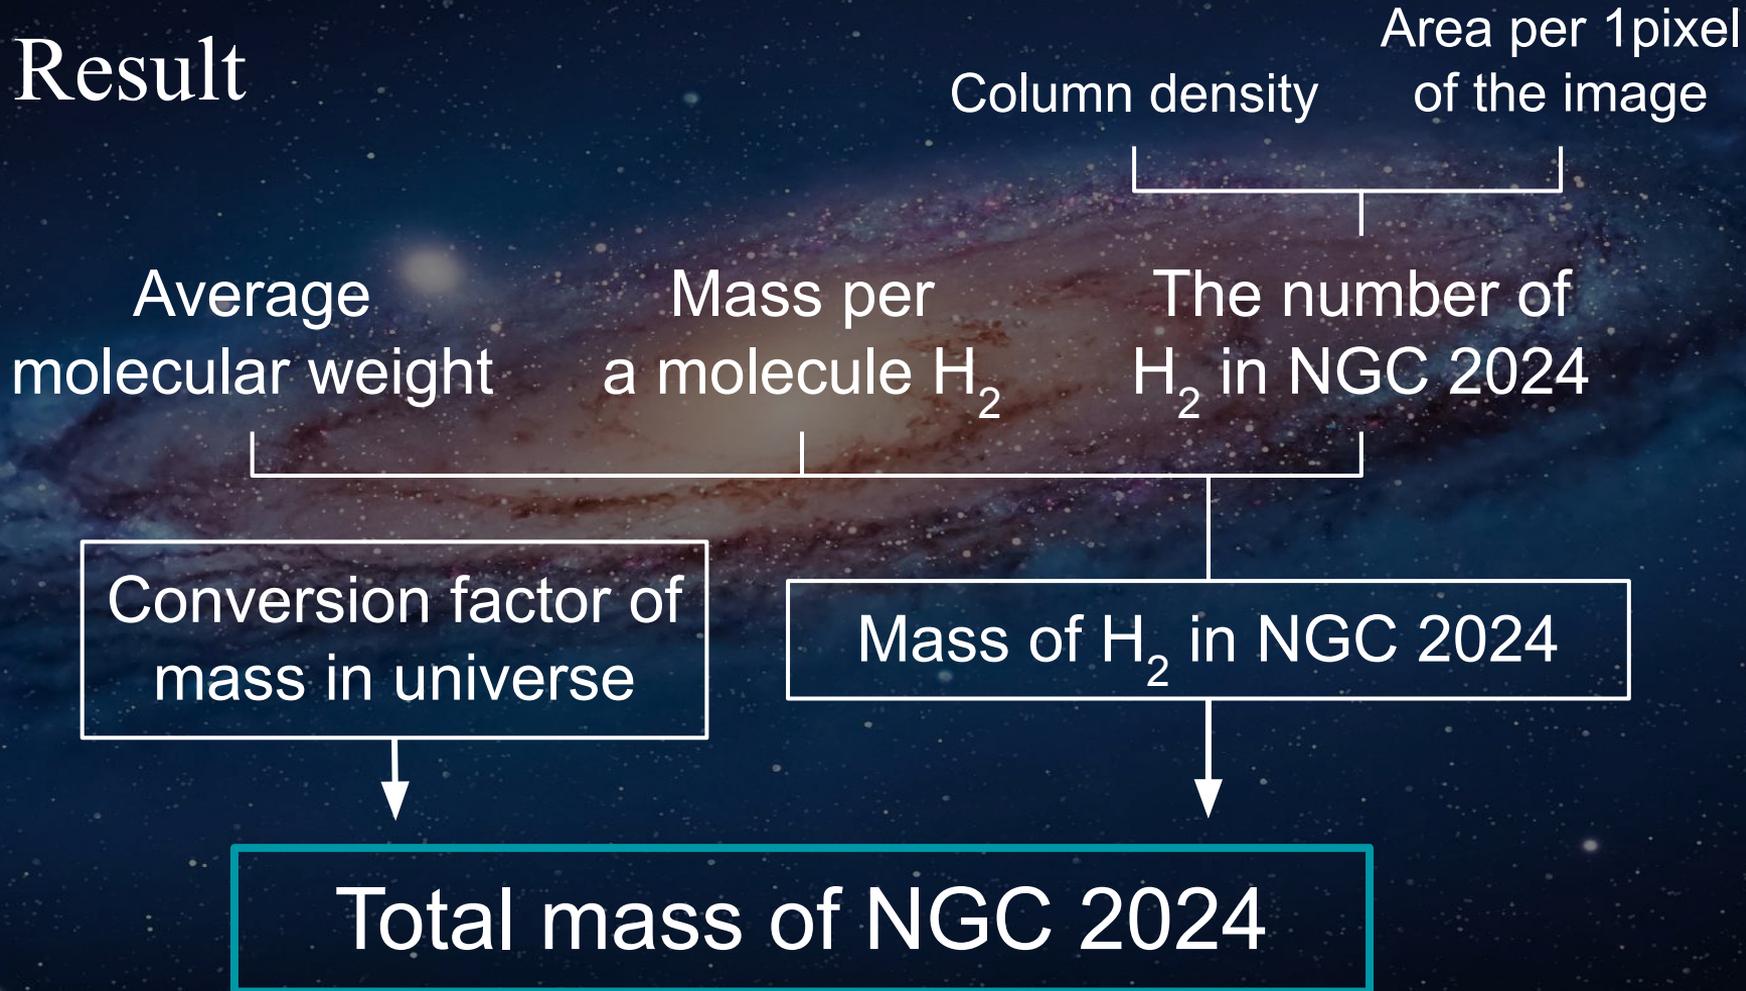

## Database

- 2MASS infrared observation

Nobeyama 45m radio telescope

## 2. Result

## 2. Result

Number of young stars  
formed in NGC 2024

mass of one star

Total mass of  
NGC 2024

Total mass of young stars  
formed in NGC 2024

Star Formation  
Efficiency

= 1.1%

## 2. Result

Avogadro  
constant

Average  
molecular weight

Total mass of  
NGC 2024

Volume of NGC 2024

Number of molecules  
in NGC 2024

Number Density  
of Molecules =  $1.8 \times 10^4$

$\text{cm}^{-3}$

### 3. Discussion

Form one star - A large amount of gas  
- High density

Is the star formation efficiency, 1.1%  
peculiar to NGC 2024?

What are the determinants of  
star formation efficiency?

## 4. Acknowledgement

We would like to appreciate  
Mr. TACHIHARA Kengo from Graduate school of  
science in Nagoya University and  
Mr. OHBA Toru from Nagoya University Affiliated  
Upper Secondary School for instructing us.

Thank you for listening
